Ultrasonic transducers may be used to provide some control over internal combustion engines. Many of these transducers include two or more electrical wires (e.g., control wires) that carry electrical signals to and from the ultrasonic transducer. A connector is typically used to couple the electrical wires to the ultrasonic transducer. Electrical wires may be wrapped around the connector to

couple to a corresponding wire extending from the ultrasonic transducer. In some cases, a connector may be configured to provide a seal around a crimp to keep contaminants from the environment from entering the connector.
